

Recent Developments in Web-enabled Vocabularies

Tom Baker

MPG EScience Seminar on Metadata Infrastructures

Berlin, 15 October 2008

Linked Data

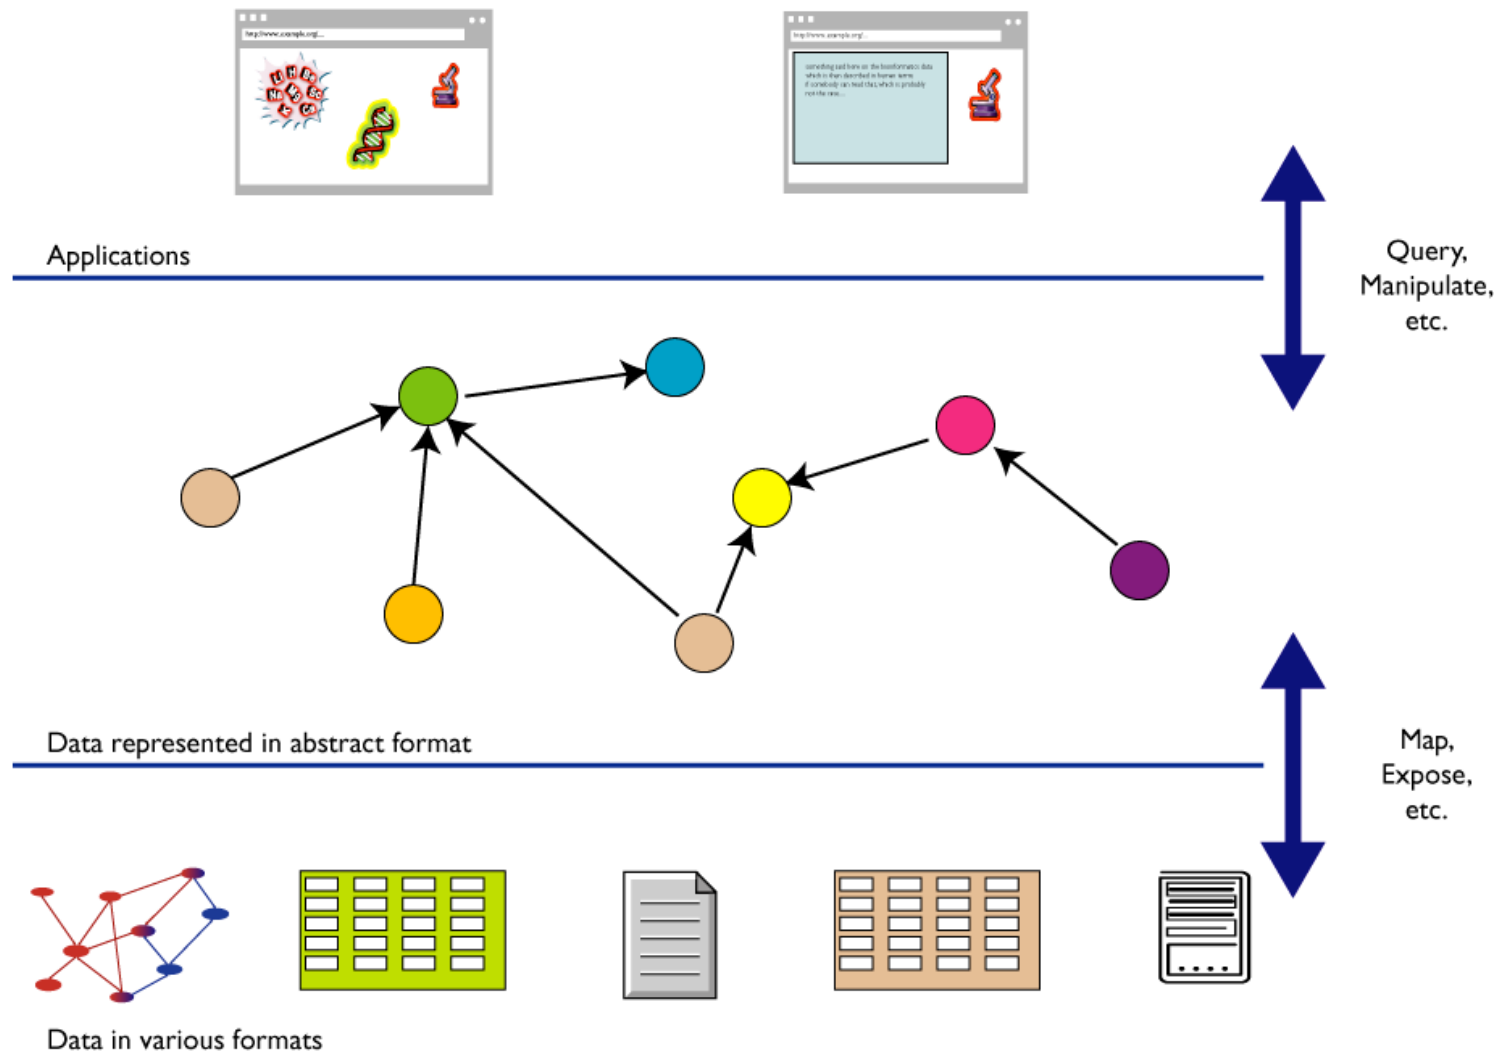

<http://dbpedia.org>

Open Linked Data

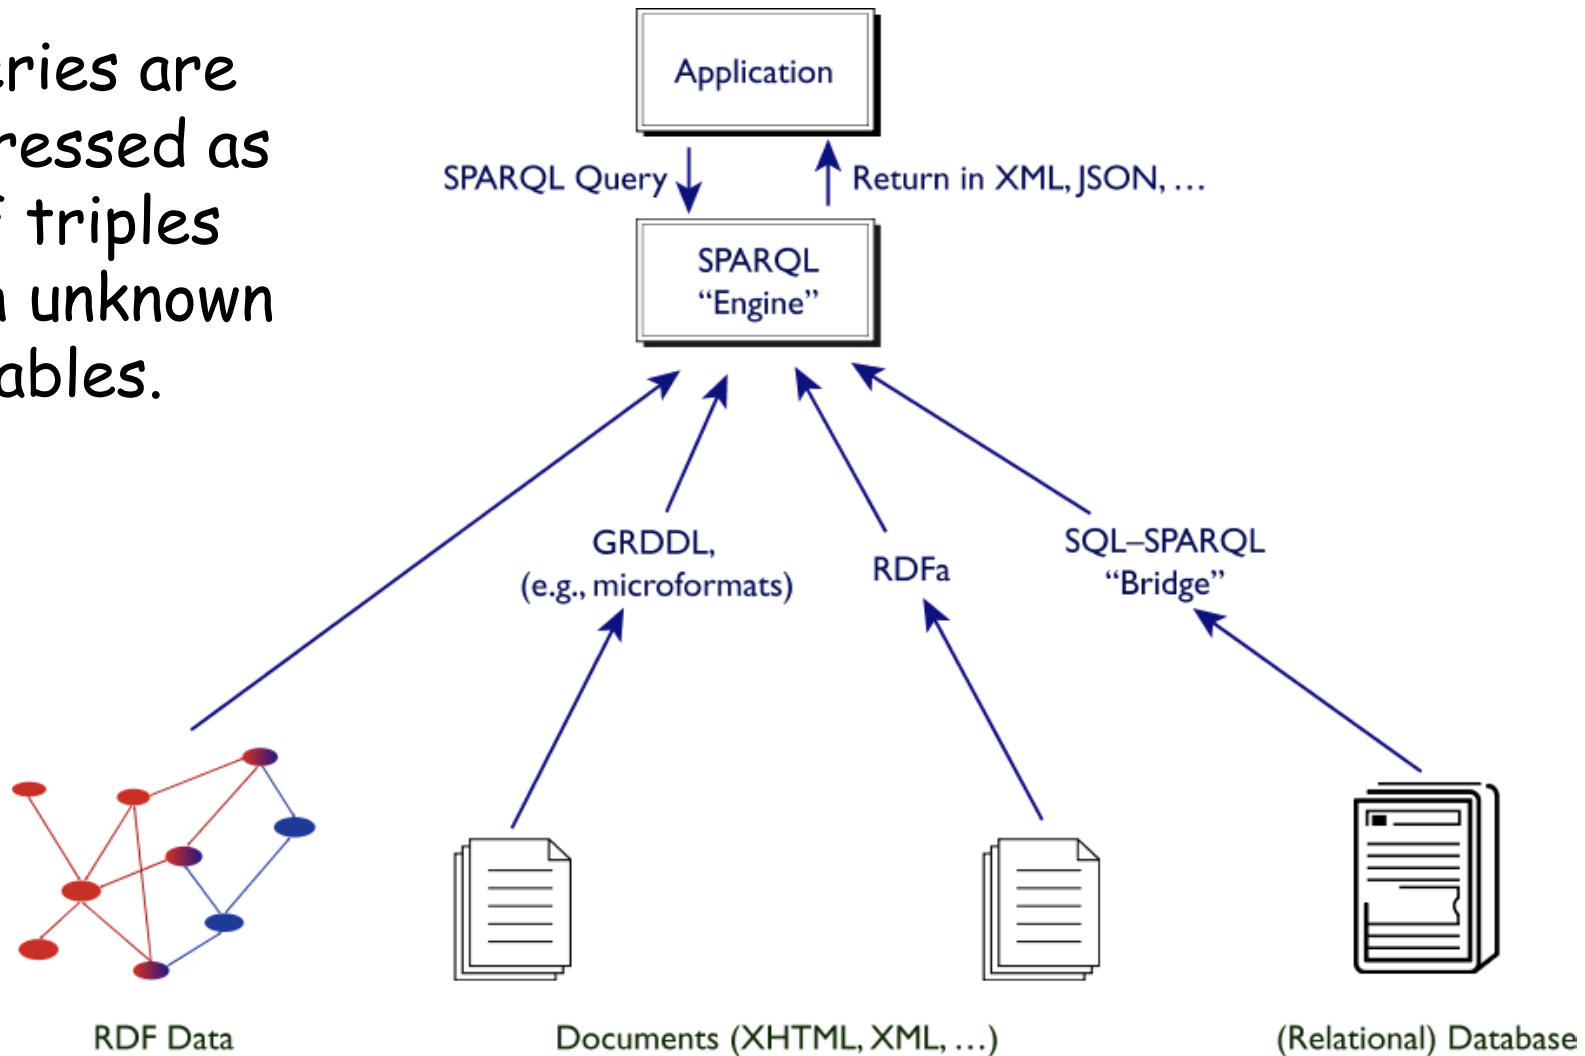

- Value of information is very much a function of what it links to (Tim Berners-Lee)
- Four rules (for maximizing unplanned re-use)
 - 1. Identify things with URIs.
 - 2. Use HTTP URIs.
 - 3. Serve information on the Web against the URIs.
 - 4. Link related material.
- <http://www.w3.org/DesignIssues/LinkedData.html>

RDF as a common format for merging data

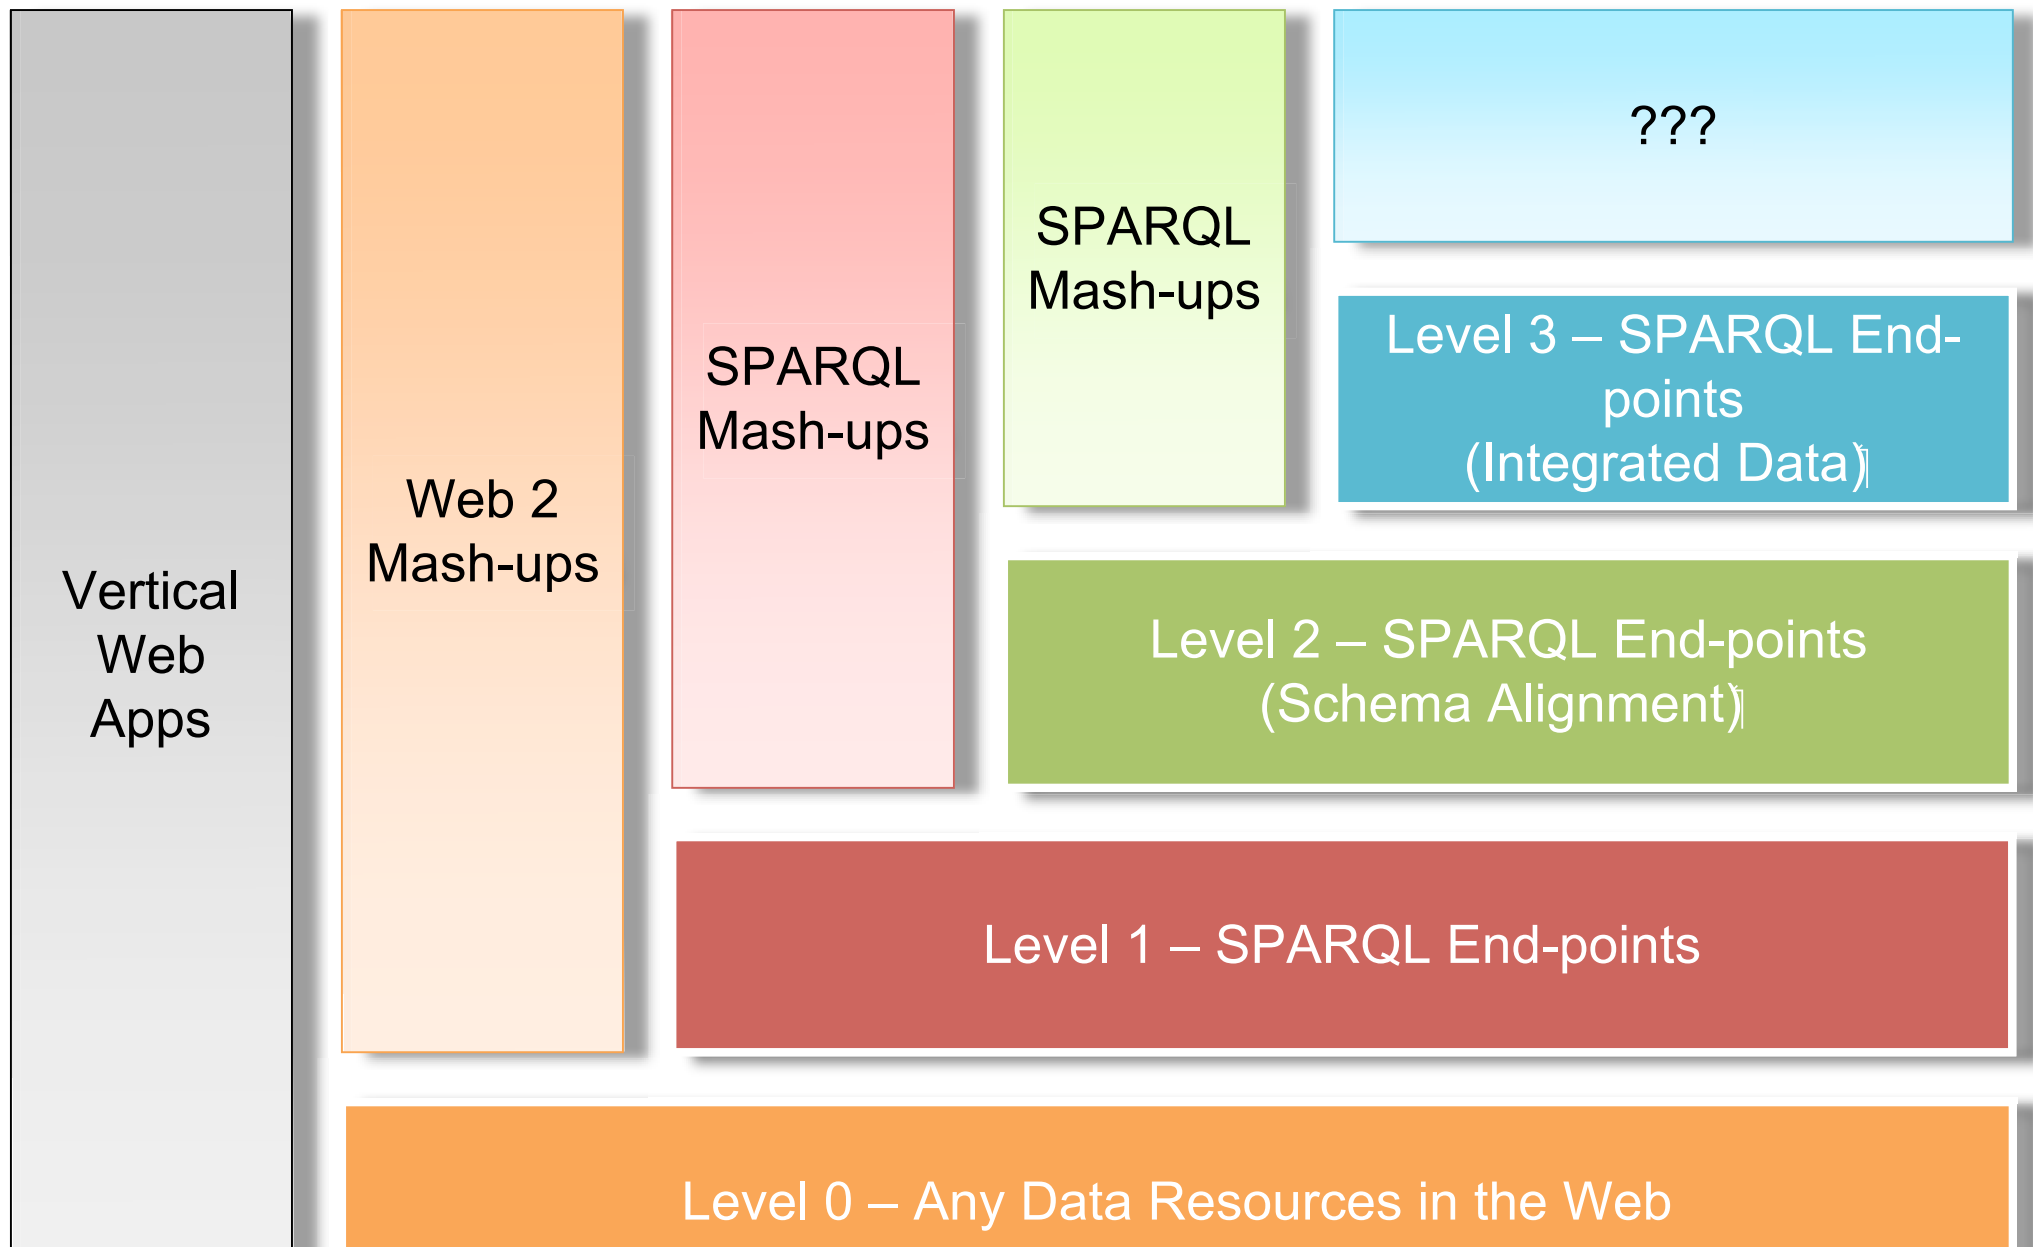

Merged data queried with SPARQL

Queries are expressed as RDF triples with unknown variables.

Data Web Layer Cake (Alistair Miles)

Interoperability Levels for Dublin Core metadata

➤ 4: Description Set Profile Interoperability

- Shared formal vocabularies and constraints in records

➤ 3: Description Set syntactic interoperability

- Shared formal vocabularies in exchangeable records

➤ 2: Semantic interoperability

- Shared vocabularies based on formal semantics

➤ 1: Informal interoperability

- Shared vocabularies defined in natural language

Getting data into triples

- **GRDDL** (Gleaning Resource Descriptions from Dialects of Languages)
 - Mechanism for extracting structured data from XML and XHTML documents and converting that data (via an XSLT script) into RDF
- **RDFa** (“RDF-in-attributes”)
 - Embeds RDF-structured data into Web pages
 - Extends XHTML with attributes for carrying RDF data
 - Data can be cut-and-paste between RDF-aware applications
- **Microformats?**
 - Small XML formats to embed in Web pages
 - Work well for well-defined contact (hCard) or calendar (hCal) information, but fields not designed to be shared across formats
 - GRDDL can be used to extract RDF triples from Microformats

Tagging

- “Taggers” create “tags” about “resources”
 - Collectively, taggers create “folksonomies”
- Problem: to represent tagging data re-usably
 - Freely created tags are not associated with structured ontologies, hence not normalized
 - Countless variants, typos...
 - Conceptualizations may differ even when purposes same
 - Often no clear need to share idiosyncratic tags
 - Research topics: models for formalizing folksonomies, formal expression of tagging data

Extract data from wiki infoboxes...

Charles Darwin

From Wikipedia, the free encyclopedia
(Redirected from [Charles darwin](#))

For other people of the same surname, and places and things named after Darwin, see [Darwin](#).

Charles Robert Darwin (February 12, 1809 – April 19, 1882) was an [English naturalist](#),^[1] who realised and demonstrated that all [species](#) of life have [evolved](#) over time from [common ancestors](#) through the process he called [natural selection](#).^[1] The [fact that evolution occurs](#) became accepted by the [scientific community](#) and the general public in his lifetime, while his [theory](#) of natural selection came to be widely seen as the primary explanation of the process of evolution in the 1930s,^[1] and now forms the basis of [modern evolutionary theory](#). In modified form, Darwin's scientific discovery remains the foundation of [biology](#), as it provides a unifying [logical](#) explanation for the [diversity of life](#).^[2]

Darwin developed his interest in natural history while studying [medicine](#) at [Edinburgh University](#), then [theology](#) at [Cambridge](#).^[3] His [five-year voyage](#) on the *[Beagle](#)* established him as an eminent [geologist](#) whose observations and theories supported [Charles Lyell](#)'s [uniformitarian](#) ideas, and publication of his [journal of the voyage](#) made him famous as a popular author. Puzzled by the geographical distribution of wildlife and [fossils](#) he collected on the voyage, Darwin investigated the [transmutation of species](#) and conceived his theory of natural selection in 1838.^[4] Although he discussed his ideas with several naturalists, he needed time for extensive research and his geological work had priority.^[5] He was writing up his theory in 1858 when [Alfred Russel Wallace](#) sent him an essay which described the same idea, prompting immediate joint publication of [both of their theories](#).^[6]

His 1859 book *[On the Origin of Species](#)* established evolution by [common descent](#) as the dominant scientific explanation of diversification in nature. He examined [human evolution](#) and [sexual selection](#) in *[The Descent of Man, and Selection in Relation to Sex](#)*, followed by *[The Expression of the Emotions in Man and Animals](#)*. His research on plants was published in a series of books, and in his final book, he examined [earthworms](#) and their effect on soil.^[7]

In recognition of Darwin's pre-eminence, he was one of only five 19th century UK non-royal personages to be honoured by a state funeral,^[8] and was buried in *[Westminster Abbey](#)*, close to [John Herschel](#) and [Isaac Newton](#).^[9]

Contents [hide]

- 1 Biography
 - 1.1 Early life
 - 1.2 Journey of the Beagle
 - 1.3 Inception of Darwin's evolutionary theory
 - 1.4 Overwork, illness, and marriage
 - 1.5 Preparing the theory of natural selection for publication
 - 1.6 Publication of the theory of natural selection
 - 1.7 Reaction to the publication
 - 1.8 Descent of Man, sexual selection, and botany

Charles Darwin

Charles Robert Darwin (1809-1882). At the age of 50, Charles Darwin had just published *On the Origin of Species*.

Born	12 February 1809 <div>Mount House, Shrewsbury, Shropshire, England</div>
Died	19 April 1882 (aged 73) <div>Down House, Downe, Kent, Engl</div>
Residence	England
Nationality	British
Fields	Naturalist
Institutions	Royal Geographical Society
Alma mater	University of Edinburgh University of Cambridge
Academic advisors	Adam Sedgwick John Stevens Henslow

Language of data, written with URIs

- URIs are the words in a new language of data
 - “classes”/“properties” like “nouns”/“verbs”
 - `http://purl.org/dc/terms/title`
 - When grammatically used, URIs are the basis of meaningful interoperability
- Established Domain Name System (DNS)
 - Global delegation of maintenance authority
 - Web infrastructure provides “dictionary” of context-independent terms

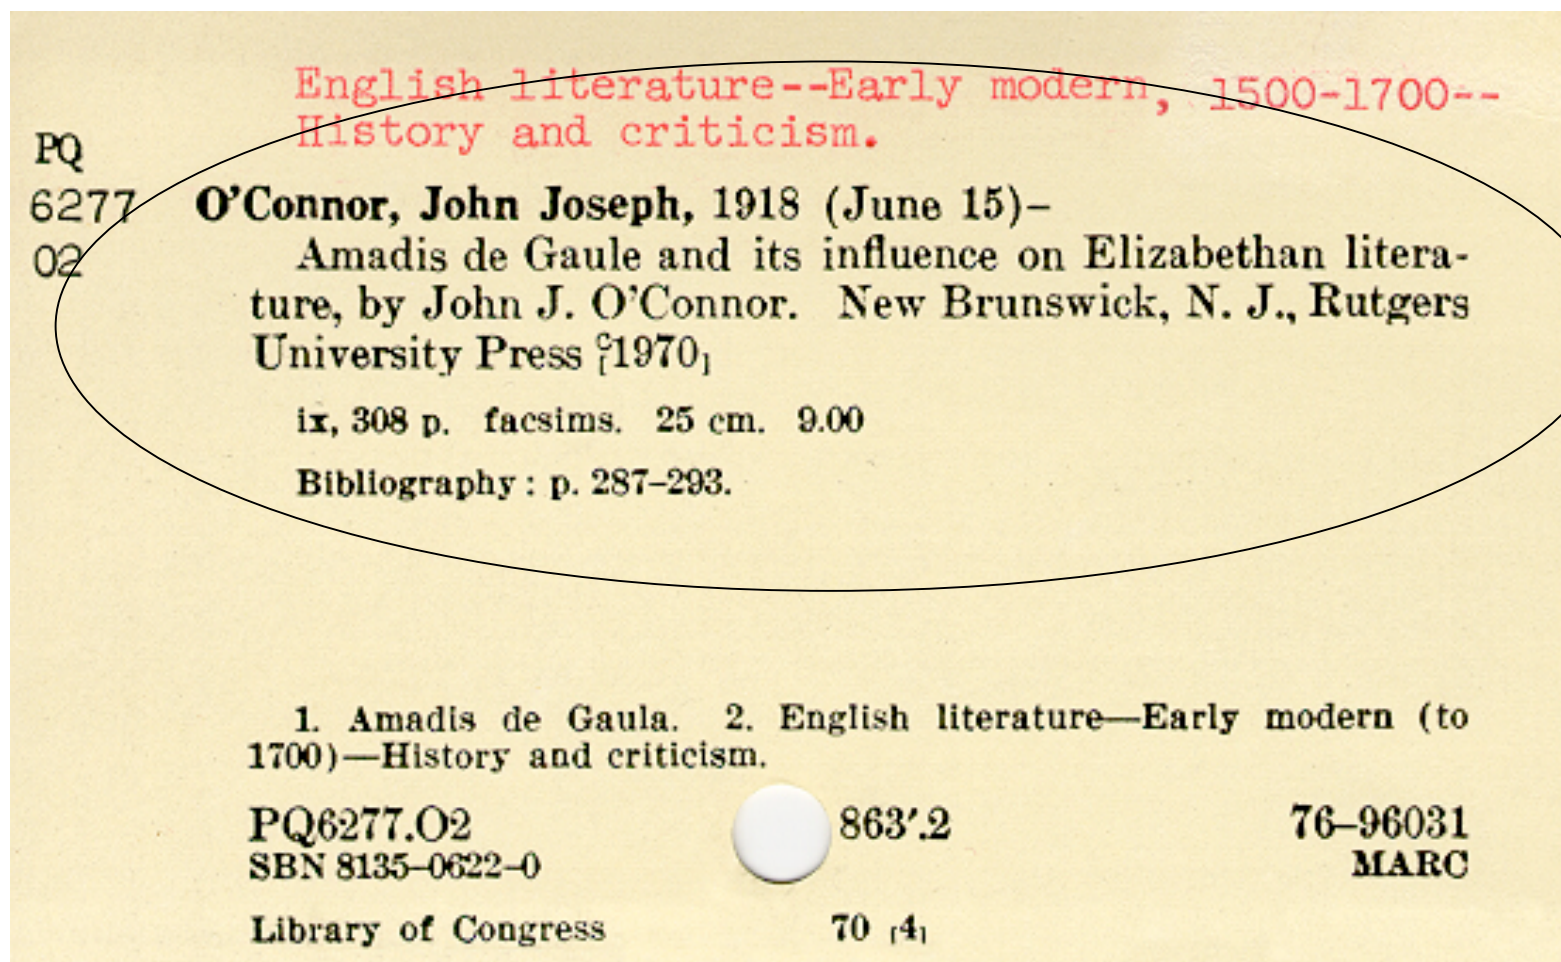

Creating shared RDF vocabularies

- Vocabularies "born RDF"
 - Simple Knowledge Organization System (SKOS)
 - Web Ontology Language (OWL)
 - DCMI Metadata Terms
- Translation of pre-Web vocabularies into RDF
 - MARC Relators (roles of agents with respect to resources) - Done!
 - RDA (successor to Anglo-American Cataloging Rules)
 - Library of Congress value vocabularies in SKOS
 - FRBR (Func. Requirements for Bibliographic Records)
 - CIDOC CRM

Library catalog card

Library catalog card – bibliographic description

Library catalog entities in RDF

- Resource Description and Access (RDA)
- Successor standard to Anglo-American Cataloging Rules (AACR)
- Based on FRBR
- Joint DCMI/RDA task force
- Prototype RDF vocabularies for bibliographic information
- Early stages

Making implicit relations explicit

SKOS Example

UK Archival Thesaurus

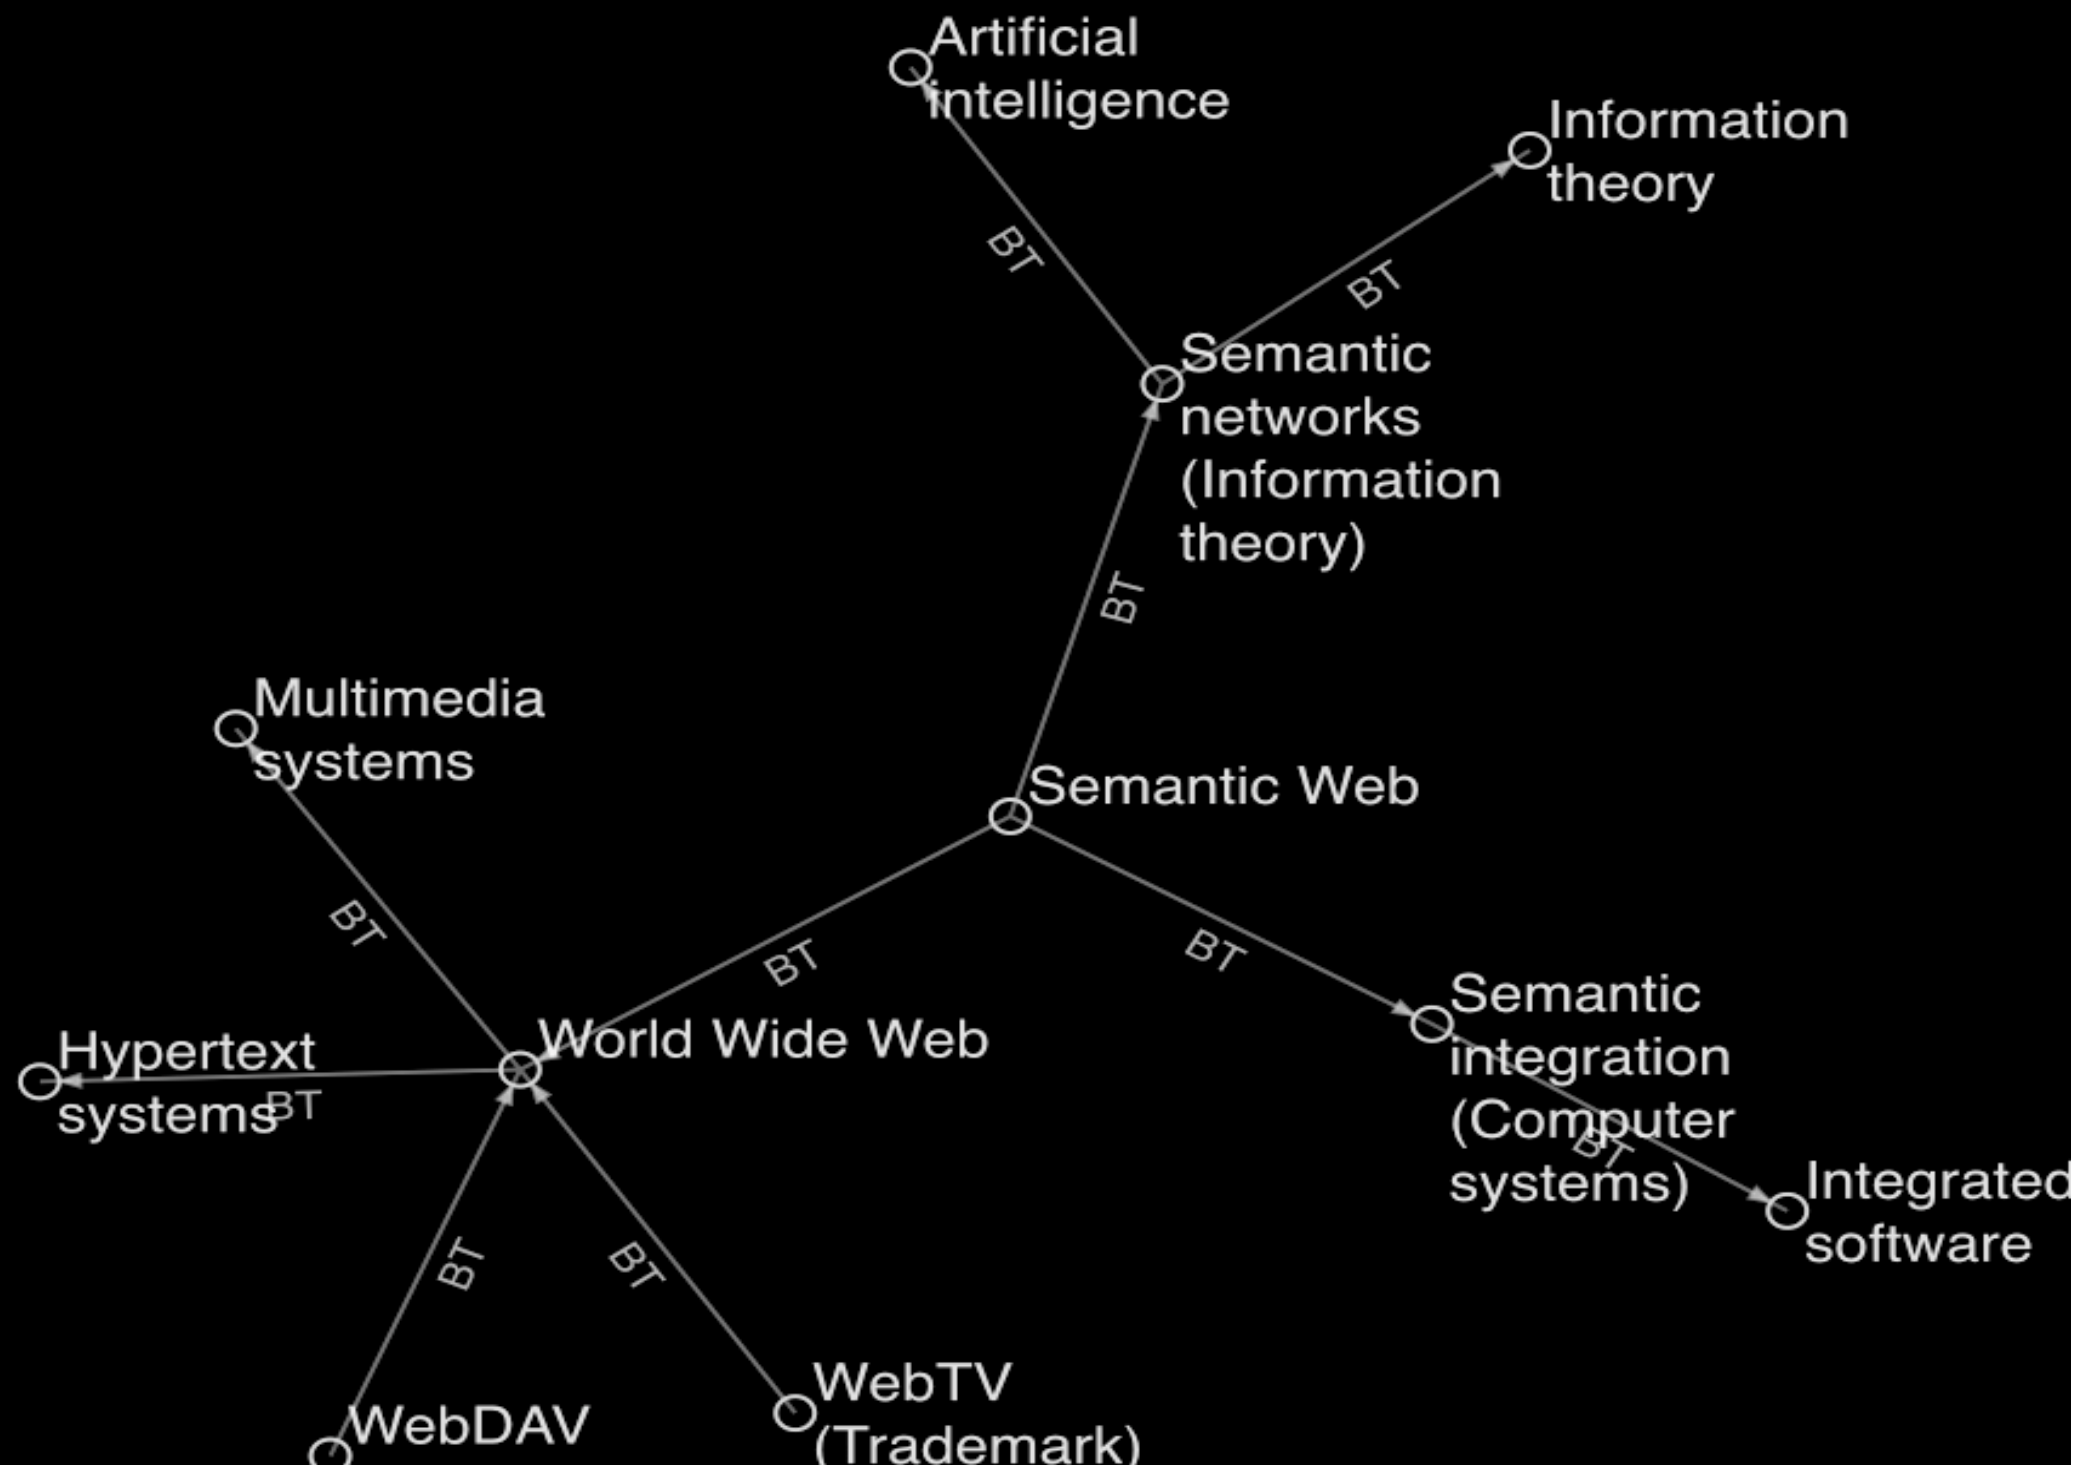

<u>Term:</u>	Economic cooperation
<u>Used For:</u>	Economic co-operation
<u>Broader terms:</u>	Economic policy
<u>Narrower terms:</u>	Economic integration, European economic cooperation, European industrial cooperation, Industrial cooperation
<u>Related terms:</u>	Interdependence
<u>Scope Note:</u>	Includes cooperative measures in banking, trade, industry etc., between and among countries.

Interoperability Levels for Dublin Core metadata

➤ 4: Description Set Profile Interoperability

- Shared formal vocabularies and constraints in records

➤ 3: Description Set syntactic interoperability

- Shared formal vocabularies in exchangeable records

➤ 2: Semantic interoperability

- Shared vocabularies based on formal semantics

➤ 1: Informal interoperability

- Shared vocabularies defined in natural language

Interoperability Levels for Dublin Core metadata

- Level 1: Informal interoperability
 - Shared concepts with natural-language definitions
 - DCMI terms have carefully crafted, well-known definitions
 - No use of formal models or term URIs
 - Test: Is there a mapping to shared elements?
 - Example: IEEE LOM reuses some definitions and maps to 15-element “Dublin Core” (ISO 15836)

Interoperability Levels for Dublin Core metadata

- Level 2: Semantic Interoperability
 - Correct use of formal RDF graph model with conformant vocabularies (eg DCMI Metadata terms)
 - Use of URIs and formal semantic relationships between terms (eg subproperties)
 - Test: Is there a mapping to RDF triples?
 - Examples:
 - All RDF data (by definition)
 - All RDF data extracted from non-RDF formats (eg via GRDDL transforms)
 - All XHTML or HTML data using RDFa or DC-HTML/2008.

Interoperability Levels for Dublin Core metadata

- Level 3: Description set syntactic interoperability
 - Level-2-compatible data packaged in bounded description sets (records) as per DCMI Abstract Model (DC-AM)
 - Conventions for citing vocabulary encoding schemes (controlled vocabularies)
 - Test: Is there a mapping to “Expressing Dublin Core metadata using the DC-Text format”?
 - Examples: All data using DC-AM-compatible specifications, such as DC-DS-XML.

Interoperability Levels for Dublin Core metadata

- Level 4: Description Set Profile Interoperability
 - Level-3-compatible data that follows the specification “Description Set Profiles: A constraint language for Dublin Core Application Profiles”
 - Additional interoperability via shared Functional Requirements and Domain Model (“Singapore Framework for Dublin Core Application Profiles”)
 - Test: Is there a mapping to DSP constraints?
 - Examples:
 - Scholarly Works Application Profile
